and confidently than you ever thought possible. Why do highway crashes occur? You may be surprised when you learn that that they are often caused by three or four factors all playing a part at the same time. Many crashes take place because of a lack of knowledge on the part of the driver. When drivers gain this knowledge, many of these crashes are avoided. When you finish reading this book, you will probably drive more safely, you will probably drive with more passion, and each time after starting the motor, the thought will probably swirl around in your mind, "Let' Er Roll."

This book is about nature considered as the totality of physical existence, the universe, and our present day attempts to understand it. If we see the universe as a network of networks of computational processes at many different levels of organization, what can we learn about physics, biology, cognition, social systems, and ecology expressed through interacting networks of elementary particles, atoms, molecules, cells, (and especially neurons when it comes to understanding of cognition and intelligence), organs, organisms and their ecologies? Regarding our computational models of natural phenomena Feynman famously wondered: " Why should it take an infinite amount of logic to figure out what one tiny piece of space/time is going to do? " Phenomena themselves occur so quickly and automatically in nature. Can we learn how to harness nature ' s computational power as we harness its energy and materials? This volume includes a selection of contributions from the Symposium on Natural Computing/Unconventional Computing and Its Philosophical Significance,

organized during the AISB/IACAP World Congress 2012, held in Birmingham, UK, on July 2-6, on the occasion of the centenary of Alan Turing ' s birth. In this book, leading researchers investigated questions of computing nature by exploring various facets of computation as we find it in nature: relationships between different levels of computation, cognition with learning and intelligence, mathematical background, relationships to classical Turing computation and Turing ' s ideas about computing nature - unorganized machines and morphogenesis. It addresses questions of information, representation and computation, interaction as communication, concurrency and agent models; in short this book presents natural computing and unconventional computing as extension of the idea of computation as symbol manipulation.
