For problems 1 & 2 use one of the Taylor Series derived in the notes to determine the Taylor Series for the given function. $f(x) = \cos(4x)$ $f(x) = \cos(4x)$ about $x = 0$ $x = 0$ Solution $f(x) = x^6 e^{2x^3}$ $f(x) = x^6 e^{2x^3}$ about $x = 0$ $x = 0$ Solution

Calculus II - Taylor Series (Practice Problems)

Example: Taylor Series for $\cos(x)$ Start with: $f(x) = f(a) + f'(a) \frac{1}{1!} (x-a) + f''(a) \frac{2!}{2!} (x-a)^2 + f'''(a) \frac{3!}{3!} (x-a)^3 + \dots$ The derivative of \cos is $-\sin$, and the derivative of \sin is \cos , so: $f(x) = \cos(x)$ $f'(x) = -\sin(x)$ $f''(x) = -\cos(x)$ $f'''(x) = \sin(x)$ etc... And we get: $\cos(x) = \cos(a) - \sin(a) \frac{1!}{1!} (x-a) - \cos(a) \frac{2!}{2!} (x-a)^2 + \sin(a) \frac{3!}{3!} (x-a)^3 + \dots$

Taylor and MacLaurin Series (examples, solutions, videos)

Taylor Series & Maclaurin Series help to approximate functions with a series of polynomial functions. In other words, you're creating a function with lots of other smaller functions. As a simple example, you can create the number 10 from smaller numbers: $1 + 2 + 3 + 4$.

Chapter 01.07 Taylors Series Revisited . COMPLETE SOLUTION SET . 1. The coefficient of the x^5 term in the Maclaurin polynomial for $\sin(2x)$ is (A) 0 (B) 0.00833333 (C) 0.016667 (D) 0.26667 . Solution . The correct answer is (D). The Maclaurin series for $\sin(2x)$ is $\sin(2x) = 2x - \frac{(2x)^3}{3!} + \frac{(2x)^5}{5!} - \dots$ $5x^5 x = - + + 120 32 6 8 2 x^3 x^5 x = 2x - 1.3333x^3 + 0.26667x^5 +$

Chapter 01.07 Taylors Series Revisited COMPLETE SOLUTION SET

Example Prove that e^x is represented by its Maclaurin series on the interval $(-1, 1)$. Solution: Let $f(x) = e^x$. Take any open interval of the form $I = (-A, A)$, where $A > 0$. Then for all t in I and for all k , $|f^{(k)}(t)| = |e^t| = e^t < e^A$. By our Corollary, the Maclaurin series of e^x converges to e^x on the interval $(-A, A)$. Since $A > 0$ is arbitrary, the Maclaurin series of e^x converges to e^x at all points x .

Solution: This is easiest if you remember that the Taylor series with center $y_0 = 0$ for f has radius of convergence 1 and is given by Using the substitution $y = x^2$, one then obtains the Taylor series for $f(x)$:

Example 2: Using Taylor series method of order four solve the initial value problem $y' = (x - y)/2$, on $[0, 3]$ with $y(0) = 1$. Compare solutions for $h = 1, 1/2, 1/4$ and $1/8$. Solution: Example 3

Differential equations - Taylor's method

Taylor series are used to define functions and "operators" in diverse areas of mathematics. In particular, this is true in areas where the classical definitions of functions break down. For example, using Taylor series, one may extend analytic functions to sets of matrices and operators, such as the matrix exponential or matrix logarithm.

Taylor series - Wikipedia

In Mathematics, the Taylor series is the most famous series that is utilized in several mathematical as well as practical problems. The Taylor theorem expresses a function in the form of the sum of infinite terms. These terms are determined from the derivative of a given function for a particular point. The standard definition of an algebraic function is provided using an algebraic equation.
